

CASCADE+DUPLEX: 4+1 COMBO

FIRM · FAST · CONSISTENT

Improved air and water balance with Cascade Plus and Duplex 4+1 combo (right) and untreated control (left).

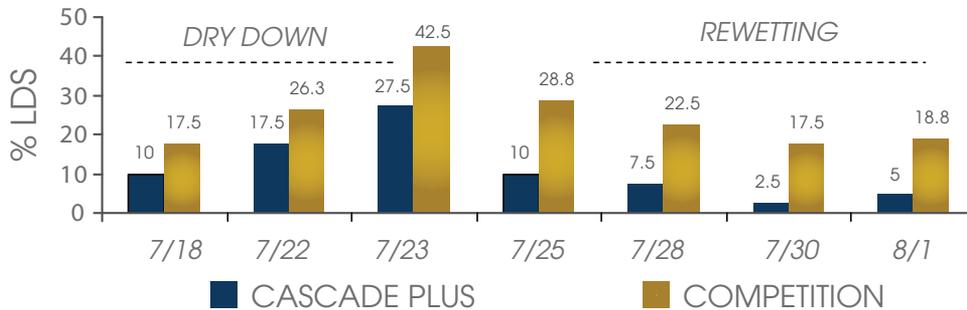

PROVEN EFFECTIVE

When it comes to choosing soil surfactants, golf course superintendents want flexibility, control and results. Feedback from superintendents confirms that a tank mix consisting of 4 oz/1,000 sq/ft of Cascade Plus™ and 1 oz/1,000 sq/ft of Duplex™ results in firmer, faster playing surfaces across a broad range of conditions.

TOURNAMENT PREPARATION

Preparation starts with a Cascade Plus + Duplex 4+1 application six weeks prior to the event, followed by a second application 30 days later. These applications result in tournament conditions by providing the proper balance of air and water in the turf root zone, no matter how wet or dry the conditions become.

SOIL RE-HYDRATION

REGULAR USE

To proactively address water management, apply 8 oz/1,000 sq/ft of Cascade Plus prior to the onset of stress or wet conditions, followed by the 4+1 Cascade Plus and Duplex combination applied monthly. By improving water infiltration and optimizing root zone hydration, this program produces firmer, faster and more consistent playing surfaces that golfers expect.
